

Nocturnal Animals

Owl

This bird waits, listens and watches for prey then swoops down. Owls come out at night.

Badger

Badgers live in setts under the ground and come out at night. They can't see very well but can hear and smell brilliantly.

Fox

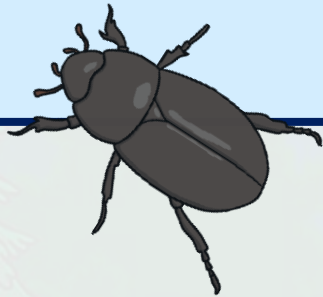

The red fox can be found both in the countryside and in towns and cities.

Foxes are more active at night and twilight and hunt alone.

Long-eared Jerboa

The long-eared jerboa is a night time jumping mouse which lives in the Gobi desert.

Night Monkey

This night monkey has big brown eyes, helping his ability to be active at night.

They are called night monkeys because they are the only truly nocturnal monkey.

Tarantula

Tarantulas come out at night as they don't like sunlight.

They live in a small, dark holes in the ground and are mostly active at night.

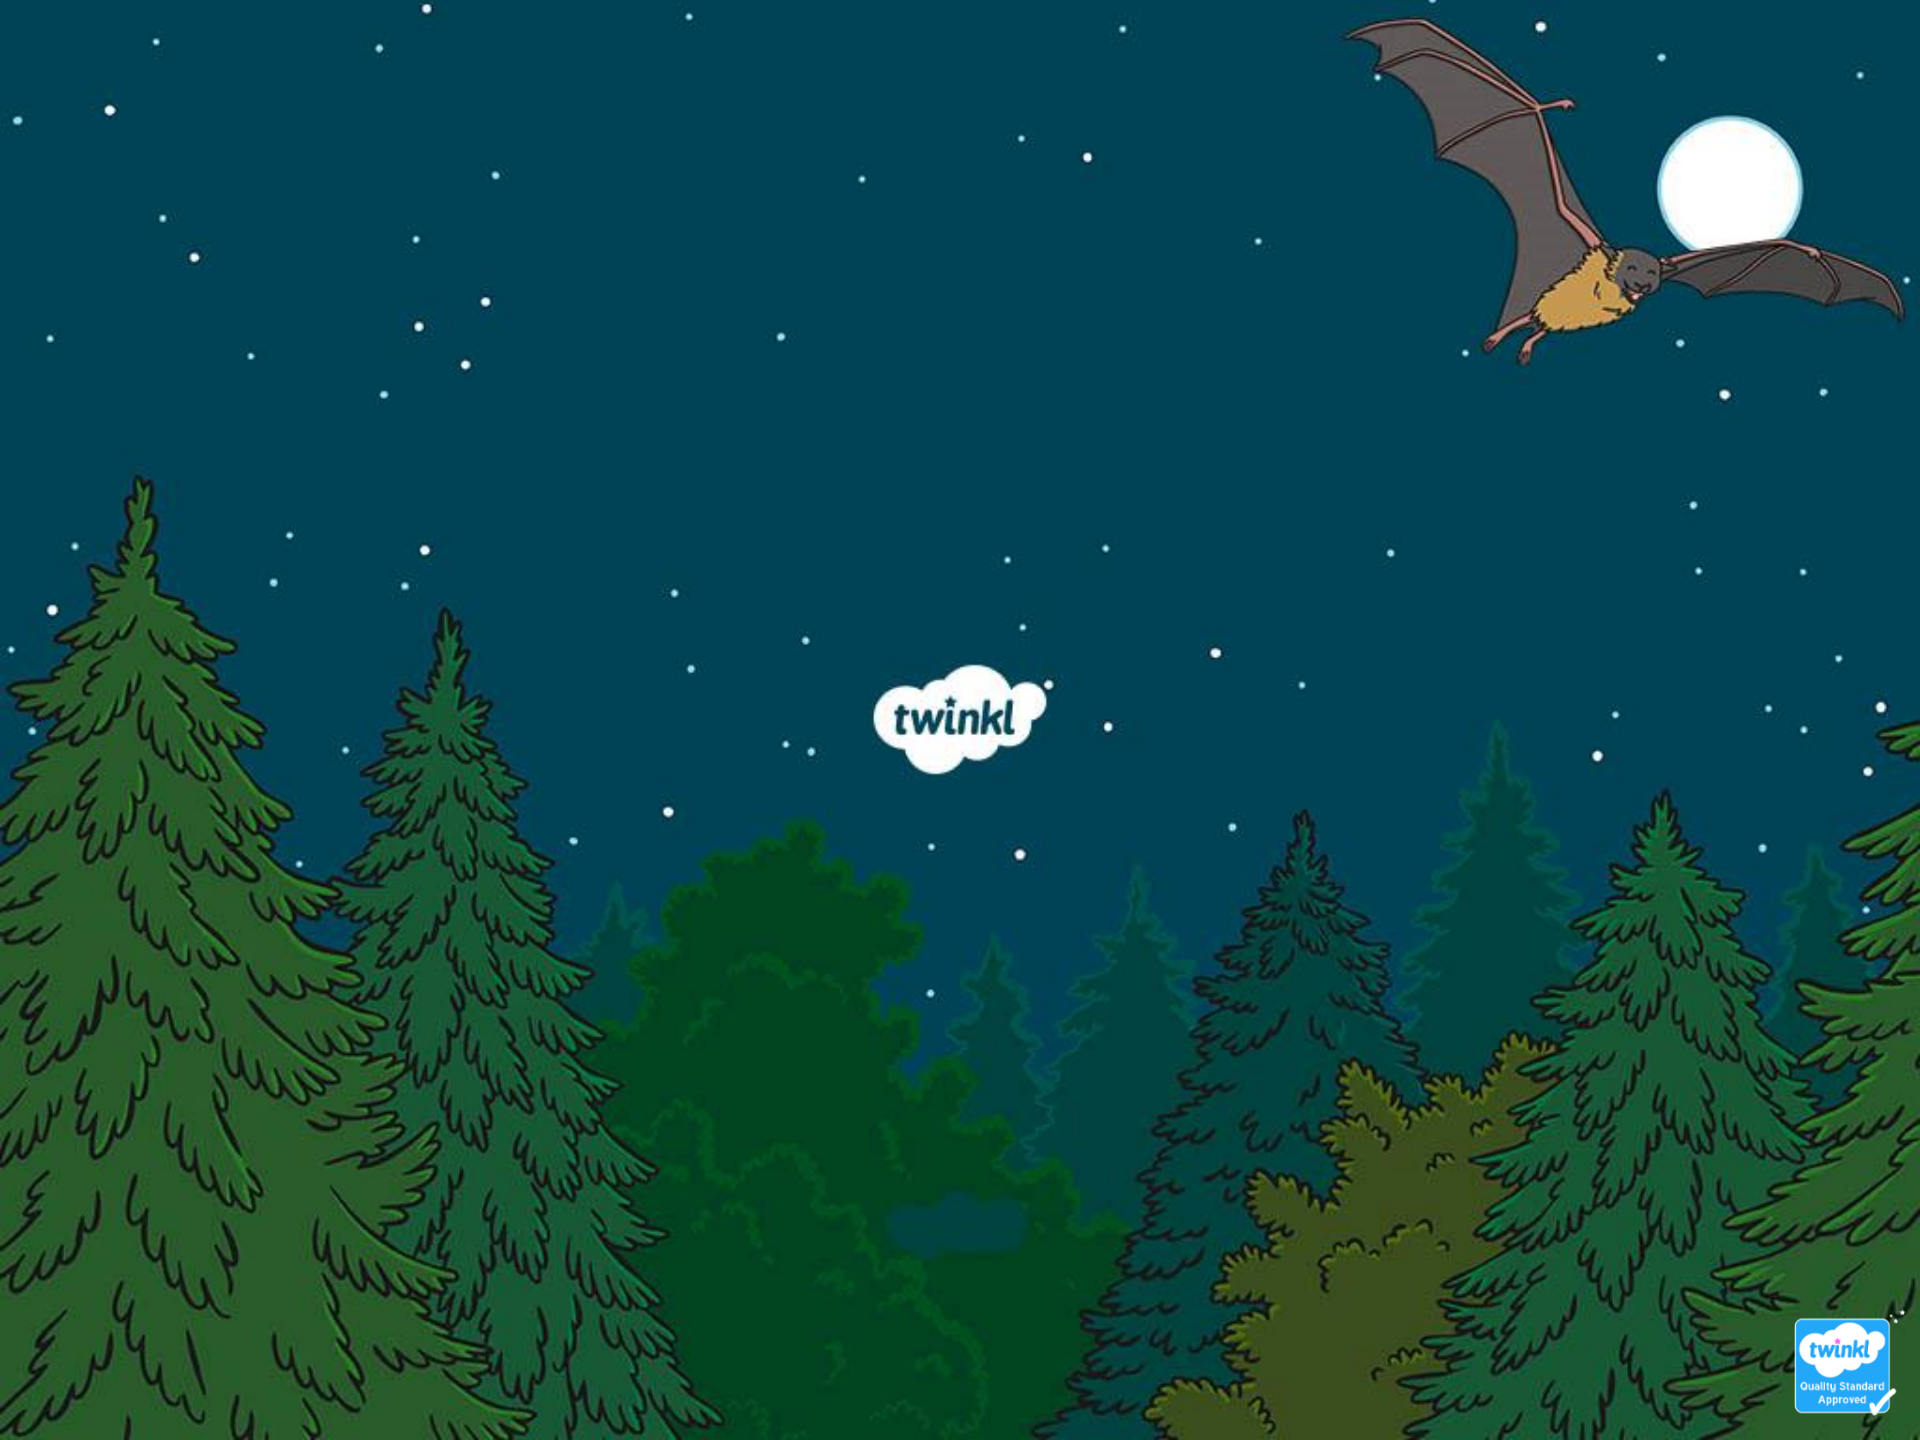

Bat

Most bats are active at twilight or at night.

It is common for bats to stay in caves during the winter and hibernate for six months.
